

Jesse Altraide

AI Automation Engineer | Backend Engineer

jaltraide10@gmail.com

EDUCATION

Covenant University, Second Class Upper (4.39)

- October 2026

BS, Computer Science, Ota, Ogun State

Coursework: Operating Systems, Database Design and Analysis, Computer Architecture, Foundations of Sequential and Parallel Programming, Introduction to Management Information Systems, Introduction to Hardware.

EXPERIENCE

Backend Engineer and Mobile App Developer, Bulvds

February 2026 – September 2026

- Shipped the full Experiences booking feature in Express, end to end: CRUD, search, filtering, pagination, caching and payments, integrated into the frontend.
- Handled 10,000+ listing records in under 300ms by optimizing database queries, migrations and Redis caching.
- Streamlined onboarding with flexible sign-in and pre-account browsing and booking.
- Fixed a recurring false “update required” prompt for live App Store users with a backend-driven app-version service: admin-controlled rollout and a grace-period safeguard against store CDN delay.
- Shipped an admin-filterable user preferences system using a validated lookup-table pattern and Postgres array-overlap queries.
- Kept 800+ automated tests across 69 suites passing with zero regressions, auditing every generated database migration before release.
- App on AppStore : [Bulvds](#)

Mobile Application Developer, Tizeti Network Limited

March 2025 – September 2025

- Delivered two production-ready Android applications, successfully deployed to Google Play.
- Integrated secure backend APIs in Kotlin for reliable authentication and persistent data storage, and worked across cross-functional teams on testing and deployment.
- Apps on Google Play: [MyTizeti](#) | [Freefiber](#)

Lead Backend Engineer, Ajjixa

July 2026 – Present

- Built and deployed a Spring Boot backend with 75+ REST APIs across four user roles, documented with OpenAPI/Swagger, using JPA/Hibernate and PostgreSQL.
- Built lead generation and distribution: capture and ownership tracking, round-robin assignment to active sales reps, an admin-approved reassignment workflow, campaign funnel metrics, and CSV/Excel bulk import with duplicate detection.
- Built the deal-closing and financials engine: one transactional call marks a plot sold, moves the lead to won and records the commission atomically, alongside installment ledgers and commission approval.
- Designed the plot-scoring engine: two 100-point scores (Builder Fit, Investment Potential) with an 80-point trust floor, JSONB boundary polygons and versioned rules so stored scores can be recalculated.
- Hardened authentication and access control: JWT access tokens with rotating refresh tokens, invite-based staff onboarding, ownership checks returning 404 instead of 403, and audit logging of every price and status change.
- Cut list payloads from ~16 MB to under 1 KB (estates) and ~5 KB (leads) with summary views; adopted 14 Flyway migrations with Hibernate in validate-only mode; deployed with a multi-stage Docker build on Render with PostgreSQL on Supabase.

AI AUTOMATION PROJECTS — KOYA TALENT

AI Automation Engineer, Koya Talent

August 2026 – Present

- Built a voice-based customer support agent with the Claude Agent SDK, Vapi and a self-built MCP server; a verified live call completed a full escalation (identity check, ticket creation, callback booking).

- Closed 53 of 66 adversarial bypass strings across two security reviews and fixed a live SQL wildcard account-data leak; verified with 370+ automated tests including live-database, race-condition and attack-string suites.
- Cut voice-agent response time from ~8s to under 3s with one long-lived session per call; added three-factor caller verification and atomic callback scheduling using a Postgres advisory lock.
- Built an autonomous lead-research agent on the Claude Agent SDK that chooses from six tools while respecting spend limits enforced in the tool layer; qualification is derived from per-criterion evidence, not model self-assessment.
- Built an n8n and Supabase operations reporting pipeline unifying Sales, People Ops and Project Delivery data into one dashboard, with per-source fallback to the last good run and AI insights comparing three reporting windows.
- Built a Next.js and Supabase proposal app with role-based access, server-side PDF generation and email-verified delivery; used atomic conditional writes to prevent duplicate approvals and fixed a Row-Level-Security race condition.
- Built an n8n and Next.js content research pipeline with per-excerpt source citations and a two-pass evaluation with hard-block floors; cut AI cost by proposing angles before running extraction.

TECHNICAL SKILLS

Languages: Java, Kotlin (Android), SQL, TypeScript

Backend: Spring Boot, Spring Security, JPA/Hibernate, Express, TypeORM, routing-controllers, REST API design, JWT authentication, Redis caching

Data: PostgreSQL, Supabase, Flyway migrations

Mobile: React Native, TypeScript, Kotlin (Android)

Tooling and DevOps: Docker, Render, Maven, Git, OpenAPI/Swagger, Apache POI, Jest, AWS S3, BullMQ, Pusher

Practices: Role-based access control, audit logging, transactional design, AI-assisted development, review and testing

AI & Automation: n8n, Claude API, Claude Agent SDK, MCP (Model Context Protocol) server development, retrieval-augmented generation, Firecrawl, Apify, Vapi
